

# PITCH BLACK

Preventive perimeter protection. A black-box hardware edge appliance for inline enforcement, explicit policy, operator-grade logging, and remote management.

Inline control for networks that do not tolerate surprises. Deploy pre-firewall, post-firewall, or with no firewall at all. Bridge-mode first, built for operators.

## Perimeter defense that stays in scope

Focused features, designed to be used: transparent inline enforcement, explicit policy, logs you can act on, and remote operations for distributed networks.

### Transparent inline (bridge-mode first)

Designed for L2 inline bridge deployments so you can add enforcement without re-architecting the network in most environments.

### Policy with intent

Define what is allowed, what is denied, and what requires review, without feature creep.

### Logs built for investigations

High-signal logging designed to answer real operational questions: what changed, what traversed, and what was blocked.

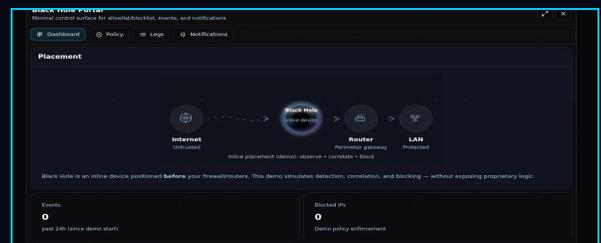

### Flexible placement

Deploy pre-firewall, post-firewall, or with no firewall. A firewall is not required to provide value.

## Hardware (sales-assisted pilots)

1U half-rack appliance. 4-port and 8-port variants. 2.5GbE and 10GbE options by configuration. Full specifications available on request.
